STRANDS AGENT AUTOMATED PNR ANALYSIS

CONFIDENTIAL · 2026

MARGIN TREND · RECOVERY

KEY METRICS · MARKET & CAPACITY

\$5.2B

Global dynamic pricing tech market size.

+1-5%

Marginal net profit lift per active booking.

10K+

Nightly PNR scan capacity per operator.

100%

Human-in-the-loop safety record — zero silent writes.

TABLE OF CONTENTS

What This Document Covers

01

The Cost Factor

Extracting invisible profit from waiting tickets.

02

The Solution Lifecycle

How the autonomous agent operates at 02:00 (Europe/Berlin).

03

Infrastructure & Scaling

Processing thousands of items without triggering API bans (SQS).

04

The Approval Loop (HITL)

Slack webhooks and operator-side security.

05

Development Roadmap

From local validation to cloud dashboard deployment.

THE COST FACTOR

Creating Money From Inefficiency

The Scenario: A €1,000 flight is locked in at booking. Two months later an identical seat — same baggage, same time window — drops to €800. No human can scan 10,000 PNRs nightly, so that €200 margin slips away.

ROI: ~50,000 yearly bookings × 2% profitable-hit rate × €40 average saving = **≥ €40,000 / year** in pure recovered margin.

SYSTEM ARCHITECTURE

AWS Serverless High-Throughput Engine

SERVICE	FUNCTION IN THE ARCHITECTURE
AWS EventBridge	Nightly cron at 02:00 Europe/Berlin kicking the ingest Lambda
Amazon SQS	Queues 10,000 bookings with a DLQ, shielding Traffics from bursts
Lambda (Worker)	One Strands + Haiku 4.5 agent per PNR, max 10 concurrent
API Gateway	Receives Slack approval webhooks, HMAC-verified before routing
Aurora Postgres	Writes every approved swap to <code>yield_events</code> ; feeds QuickSight

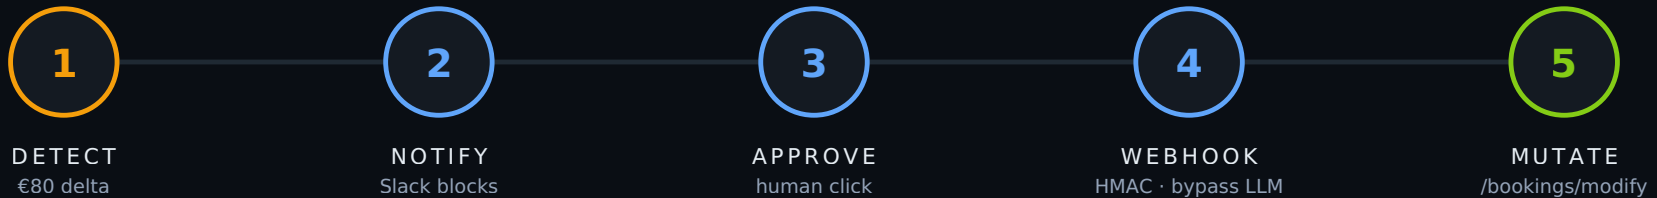

STRANDS TOOLING

The Margin Finders

- `use_traffics` ▶ `/offers/{code}/alternativeFlights`
- Pings the Traffics spine to query identical alternative planes.
- `calculator_tool` ▶ deterministic (New – Old) delta
- Prevents LLM mathematical hallucinations — arithmetic is never model-generated.
- `slack_tool` ▶ operations channel `#yield-ops`
- Dispatches interactive UI blocks (Approve/Reject) showing the found margin.

THE APPROVAL LOOP

Zero Unwanted Actions

The agent runs fully autonomous up to step 2. At step 4 the Webhook **bypasses the LLM entirely** — deterministic code (and only deterministic code) ever touches production bookings. One locked path in, one locked path out.

INVESTMENT & ROADMAP

Execution Strategy

01 · VALIDATION	0-1 mo	Prove the prompt logic isolates profit perfectly, locally.
02 · CLOUD FARM	1-2 mo	Deploy AWS SQS. Tune rate-limit handling for 429s.
03 · OPERATIONAL	2-3 mo	Slack webhooks + direct mutation scripts.
04 · BIG DATA	4+ mo	Amazon QuickSight "Yield Dashboards" for C-level.
